DREAMCATCHER

A science fiction story

Prologue

The sound of a burning hearth was the first thing Ludwig heard. It was humming quietly and sometimes making a loud cracking noise, as if the flames were sharp teeth biting through the logs, chewing them with vigor and satisfaction. It made Ludwig hungry, as he sat in an old leather armchair curled under a blanket.

It was a cold winter night in Norway, the winds howling outside the house walls, and Ludwig knew that a trip to the cold kitchen would drain all the warmth and happiness out of him. Thankfully, he did not have to make it, as he suddenly found he was already holding a tuna sandwich in his right hand. It is a very good feeling indeed, to recognize a hard problem and then watch it unravel all by itself. Sadly, though, Ludwig's time was nearly running out, and there was an alarm at the back of his mind ringing louder and ever louder. And he knew that he would soon wake up and leave the house and struggle against the frosty winds on his way to school. It was unfair, terribly unfair, that circumstances should have aligned so perfectly, only for Ludwig to be drawn out of this dream and into mundane reality, where nothing was ever perfect. Just before fading away, the remnants of Ludwig's consciousness were filled with anger and defiance, and he willed only for one thing—to keep the sandwich, the gift of this merciful world.

But it was too late. Sharply Ludwig opened his eyes and sat up in his bed, all sleepiness drained out of him. The memories from the dream were still clear in his mind, but now they seemed fake and impossible. Ludwig's house had neither a hearth, nor any leather chairs. Feeling slightly disappointed, Ludwig reached out with his right hand to silence the alarm that kept ringing, but—oh wonder!—his hand was holding a tuna sandwich, just as luscious as he'd remembered it. He turned it over and saw that it was just a regular sandwich, yet somehow it felt both alien and familiar at the same time. Ludwig could have pondered the reasons and consequences of what had just happened, but instead he did what any prudent 9-year-old would do—he quickly ate the sandwich and started packing his bag for school.

Not long after, a similar event occurred, and this time it shook humanity to its very core. A young forensic analyst named Paul Mason finally got home at eleven p.m. after a hellish day at work. He had just moved to South Carolina, and he had just examined his first crime scene.

He went into this line of work because he had always been good at noticing details, and his life had always felt too ordinary, so he had decided to spice it up by connecting his career with crime. However, after seeing the site of a gruesome murder deep in the national forest, after methodically examining the layer of blood splashed over the bushes, after counting the poor girl's broken teeth and noticing her torn clothing and the bruising around her crotch, and the marks of dried tears around her dead eyes, he was starting to seriously doubt his career choices.

Paul could only console himself by thinking of the forest. He had seen its full glory from the helicopter on his way to the crime scene. An ocean of green, stretching into infinity, calm and immortal. What was this murder, but a tiny speck of crimson-red death in a vast, boundless sea of green growing life? As long as those mighty trees were standing tall and strong, he thought, he could also find the strength to do this job. Because he had chosen it, and because someone had to do it.

Feeling broken but resolute, Paul lay down on his bed and closed his eyes, immediately falling into sleep. The next moment, he was back in the forest. He could not really understand why he had come back, because the body, the signs of struggle, the broken branches and stumped grass—everything was mysteriously gone, just like nothing had ever happened. *Where's the blood?* Paul thought, *did a rain wash it all away?*

As he walked around, he noticed the wind growing stronger and the daylight growing dimmer, the clouds above getting darker. Then the first drop of rain landed on his open palm, and it felt like a knife stabbing into his soul, because it was the crimson-red color of blood. Then another red droplet landed on his shoulder, then two more on his forearm, and a feeling of primal dread slowly crept into Paul. He could hear the trees croaking and shaking, as if trying to uproot themselves and run away, all to escape this rain which was Death itself. He could feel the rusty smell of blood as it started to pour from above.

Soon the whole sky was red, and Paul was red, and all around the green treetops and the bushes and the grass were all drinking this red poison and becoming the same shade of crimson-red. And Paul knew that they would never change back, that the horrible red drops had seeped and soaked into the trees and stained their very DNA. He knew that the green color of life and health would never be seen again.

Paul woke up at nine a.m., his bedroom sheets drenched in sweat. They were soaking wet, but they were still green, and Paul let out a sigh of relief. It was all a dream. Then Paul thought about the previous day and the murder, and felt like shit again. *At least the sky ain't raining blood,* he thought with a thin smile.

Then he opened the window curtains to let in the morning sun, and his smile instantly disappeared, and his momentary relief turned to ash. The trees in the yard had leaves the color of blood, a familiar, but also somewhat alien shade of red.

Six hours before, while it was three a.m. in South Carolina, the time was eight a.m. in Berlin, twelve p.m in Astana, and four p.m. in Tokyo. All around the eastern hemisphere people looked up from their desks, stopped in the streets, left whatever they were doing to watch all the treetops, the decorative bushes, the lawns, and the house plants slowly turn crimson-red from top to bottom, as if someone were pouring viscous blood on top of them.

For a few minutes, no one could tear their eyes away from this foreign, yet painfully familiar color. They were like prey that stares in the deadly eyes of a predator, unable to look away and paralyzed by fear. They felt like they were looking into the eyes of Death.

Paul Mason came forward with a public apology the next day, but out of the few people who heard it, no one believed he was the cause of this worldwide tragedy. Paul himself died from exhaustion a week later. He could not allow himself to fall asleep, terrified of what his nightmares might do onto the world.

Since then it was not long before humanity woke up to this supernatural phenomenon, and realized that Paul had probably been telling the truth. Videos popped up on the Internet, showing people floating above their beds while asleep, or furniture changing shape and color, or objects appearing out of thin air. Soon there were official statements recognizing what came to be known as *reverse manifestation,* and governments around the world understood that this was an existential threat to humankind. If one man can alter the DNA of trillions of plants in his sleep, what stops someone from dreaming about killing someone they hate? What stops them from dreaming a nuclear explosion? Of all people in the world, politicians are by far the most hated, and they know it better than anyone. So, when reverse manifestation made itself apparent, the powers of the world felt uniquely compelled to do something about it. It was a knife hanging above their heads.

Reverse manifestation was a new and mysterious phenomenon, but it would surely fall into the domain of science eventually, for it was an observable part of nature and not a figment of the mind. With no lack of funding and no lack of talent, in one mere year humanity

developed a scientific framework around reverse manifestation. It was believed that an alternate universe existed, called the Dreamscape, that was different from our own, and that one could enter only in their sleep. To postulate the Dreamscape was necessary to prevent the violation of conservation laws: how else could an item simply appear out of nowhere, manifested by someone dreaming about it? Since neither energy nor mass can be created or destroyed, it had to have come from somewhere. Next came the questions of how humans can access the Dreamscape, and whether humans are the only ones that can do it, and what the laws of the Dreamscape are. Mammals had been known to show brain activity during sleep that was similar to having dreams, and numerous experiments were conducted to try and provoke reverse manifestation in non-human animals. These experiments made one thing clear: only humans can manifest dreams. This conclusion led the way to the idea that reverse manifestation is intimately connected with the defining feature of the human species—consciousness.

It was theorized that a person's consciousness is not a material object, nor is it a mystical thing outside of the rational domain. Instead, it is a *pattern* that the human brain exhibits through its activity, akin to a computer program running on hardware. The brain is the hardware, the consciousness is the program. This program keeps running even when the person is asleep, however it loses connection with the real world, becomes decoupled from it. In this state the program is replicated by the Dreamscape, through a mechanism yet unknown. The nature of the Dreamscape is such that events and thoughts are the same thing. To imagine something is the same as to manifest it. In other words, the Dreamscape is a world of patterns, a world of waves that propagate through some unknown medium. It is not unreasonable that the native patterns of the Dreamscape are also a form of consciousness, in which case it might be a sentient being who is interested in replicating other sentient beings' minds in itself, a program that simulates other programs.

Once in the Dreamscape, a person's consciousness enters a world of experience entirely created by thought. The thought becomes reality in the Dreamscape, and through some unknown channel it can become reality in our own world, presumably since two instances of the same program share a link, similar to quantum entanglement between particles. This link came to be known as the *mind tunnel*. The sentient being within the Dreamscape may be able to utilize the mind tunnel to enact change in our own universe. Perhaps, the Dreamscape had discovered the human civilization only recently, which is why reverse manifestation had never been recorded in history.

A very fortunate discovery was the fact that the mind tunnel was typically very narrow, so most people were incapable of manifesting any large-scale events in their sleep. However, there were outliers—extraordinary individuals who could build whole cities in their sleep, who could make all cats in the world bark like dogs, or teleport a mountain to the moon. If the mind tunnel of the average person were one meter in diameter, Paul Mason's mind tunnel would be as wide as the continent of Africa. It was a wild stroke of luck indeed, that Paul Mason's first manifestation was so harmless, and it was a hero's act to stay awake until his very death, for there is no saying what horrors might have come alive if he had allowed himself to enter the Dreamscape again.

As soon as scientists developed a method of measuring the width of a person's mind tunnel, people all over the world underwent mandatory testing. Of people like Paul Mason, there was fewer than one thousand on the planet. These people were not to be envied, as they were hauled to special facilities for monitoring, and were forced to take experimental drugs that would prevent them from having dreams.

Yet even with the most dangerous people isolated, the threat still loomed over human society. During the first months of research, a prison guard fell asleep at his post and accidentally opened the electronic locks in half of the prison's cells, setting free hundreds of criminals. A couple of weeks later, someone fell asleep on an airplane and manifested a bird that flew into its turbine and caused the airplane to crash into the ocean. Only ten passengers survived.

Clearly, even small manifestations could produce drastic results, and the researchers had to come up with a method of limiting reverse manifestation on a global scale.

Chapter 1
